

ChikitsaCloud – Your Personal Health Wallet

Empowering individuals to understand, store, and track their medical data for preventive healthcare decisions.

Presented by : VibeIT

P

The Problem We're Solving

Medical reports are scattered

Medical reports are scattered and difficult to manage

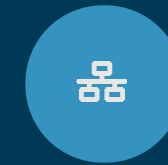

Difficulty interpreting reports

People struggle to interpret their medical reports

Early warning signs unnoticed

Early warning signs often go unnoticed

No centralized tracking system

No centralized AI-powered personal health tracking system

Health data exists. But actionable insight is missing.

Introducing ChikitsaCloud

Secure Storage

Securely store medical reports including PDFs and images with encrypted access control and audit trails to protect patient privacy.

Structured History

Maintain a clear, structured health history for each patient, enabling quick retrieval of past diagnoses, medications, and tests.

AI Abnormality Detection

Detect basic abnormalities using AI-assisted analysis to flag potential concerns in records and imaging for clinician review.

Guidance for Care

Receive intelligent guidance on when medical consultation may be needed, helping prioritize follow-up and referrals.

Current Features

User Profile Data

Stores personal attributes such as height, weight, blood group and other essential demographics for personalized health insights.

Medical Record Storage

Upload and securely store medical images and PDF reports for easy retrieval and long-term record keeping.

Share Access

Share records via QR scan or send and accept secure invites to grant caregivers or providers controlled access.

Nearby Hospitals

Find hospitals by GPS or manual location with details: name, address, phone number and distance from current location.

Basic Abnormality Detection

Detect basic anomalies (BP, SpO2, hemoglobin, cholesterol) based on user-inputted measurements and thresholds.

Secure Authentication & Data Privacy

Implements strong authentication and privacy controls to ensure patient data is protected and access is auditable.

Revenue Model

Tier 1 - Free Plan

- Store up to 10 medical records securely
- Share access with 1 designated member
- View nearby hospitals and clinics list
- Basic abnormality detection for records

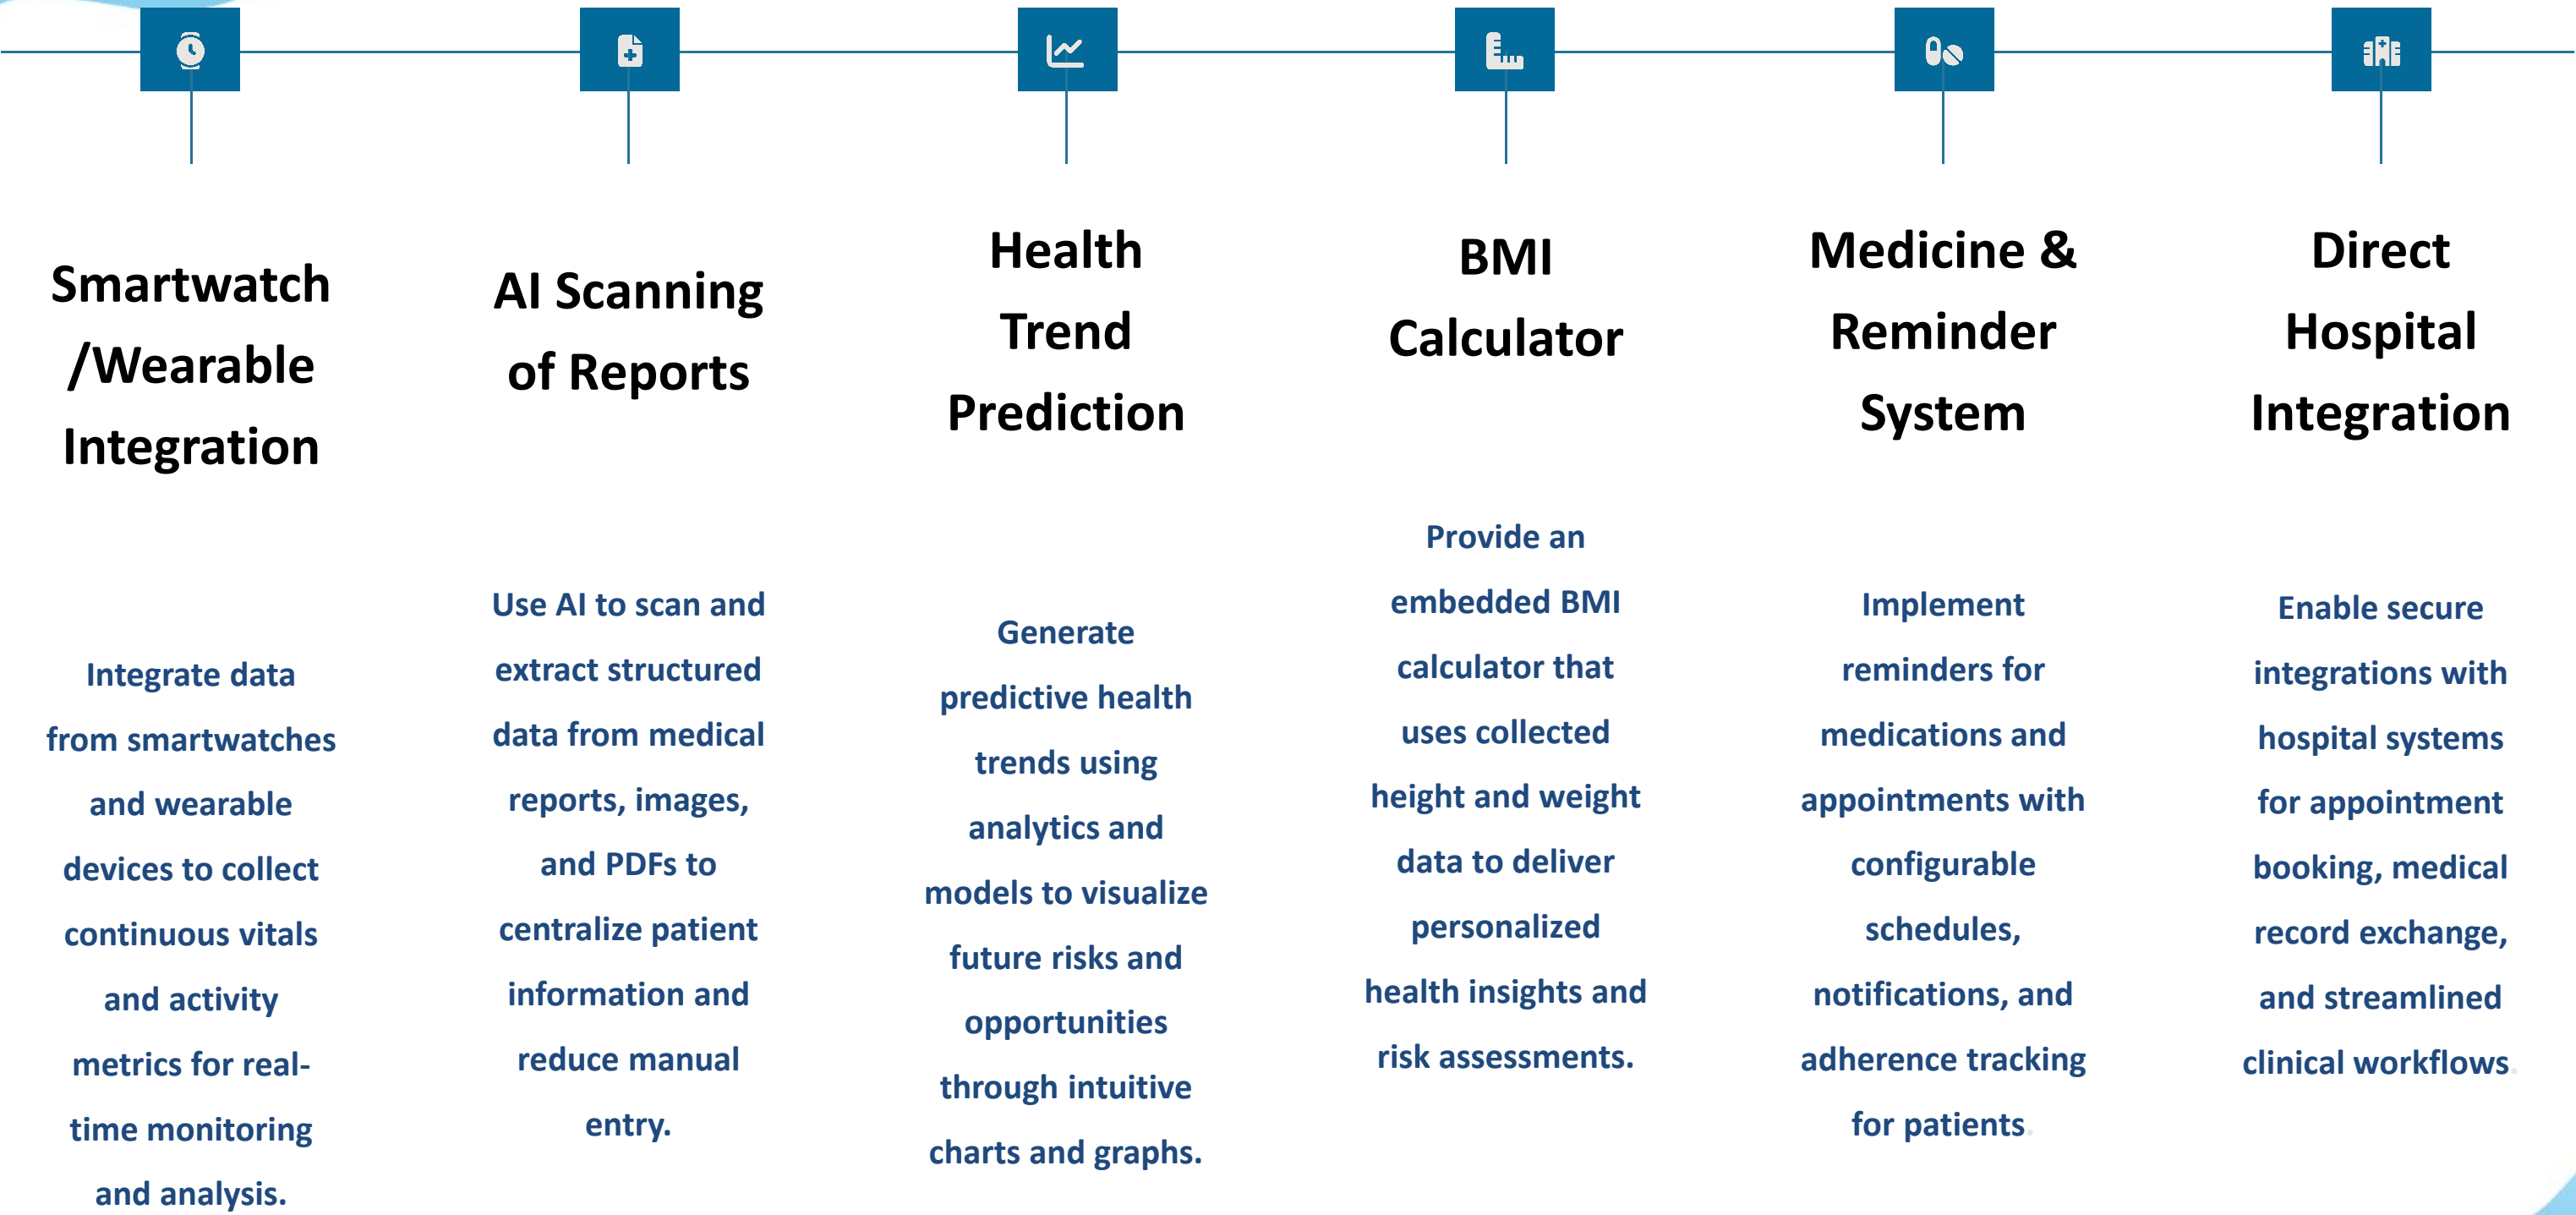

Tier 2 - Premium Individual Plan

- Unlimited medical record storage capacity
- Share access with multiple family members
- Advanced AI-based abnormality insights
- Priority customer support and assistance

Tier 3 - Premium Group Plan "Health Bubble Plan"

- Shared access among multiple group users
- Group dashboard view for collective health
- Group subscription pricing and management

Future Expansion Plans

Technology Stack

Frontend

Flutter — Used to build the Android mobile app UI because it allows fast development with a single codebase and clean, modern design.

Backend

Python FastAPI:

Used to build high-performance APIs; chosen because it's fast, simple, and integrates smoothly with machine learning models.

Database

Supabase (PostgreSQL) + SQLAlchemy:

PostgreSQL stores structured medical data reliably, and SQLAlchemy connects the database to Python securely and cleanly.

AI & Processing

Machine Learning – NumPy, Pandas, Scikit-learn, Joblib:

Used for data processing, training ML models, and saving them for real-time predictions inside the backend.

Security & Cloud

Secure authentication and encrypted cloud storage — Identity management, encryption at rest and in transit, and cloud best practices.

Impact & Vision

Encourages early detection of health risks

Facilitates timely screenings and alerts to identify potential issues before they escalate.

Promotes digital health awareness

Empowers users with accessible tools and education to understand and manage their health digitally.

Reduces negligence in medical tracking

Improves adherence to monitoring and follow-ups through automated reminders and insights.

Builds a scalable AI-powered personal health ecosystem

Leverages intelligent analytics to provide personalized recommendations and seamless care coordination.

Empowering individuals to take control of their health data.
